

Tracsis wins major rail contracts

May 26, 2020

Tracsis, a leading provider of software, hardware and services for the rail, traffic data and wider transport industries, has been awarded two major rail contracts.

The first award is for the provision of their award-winning **TRACS Enterprise** resource planning and management solution to another major UK rail operator. This multi-million pound contract will be delivered over multiple years and includes the renewal of some existing systems already licenced by the customer, plus significant levels of additional functionality through the **TRACS Enterprise** Suite, including the **ATTune** timetabling software – which is now part of the Tracsis suite of products.

The second contract win is a major order for the provision of **remote condition monitoring technology**, in addition to our associated **Centrix** software and related support services, to an existing customer. The contract is for several hundred thousand pounds, and will be delivered over the coming months.

Chris Barnes, Chief Executive Officer commented: “We are delighted to have secured these major contracts with two major UK rail customers and look forward to delivering these projects in the months to come.

“The UK rail industry continues to adopt our award winning TRACS Enterprise software and remote condition monitoring technology, both of which can bring significant benefits to operators, and these latest wins are testament to the strength of our team and quality of our market-leading products.”
